5 Climate change in Vietnam

1 Concepts: Climate change is a change in climate over a long period of time because of the impact of natural conditions and human activities.

2 Characteristics of climate change

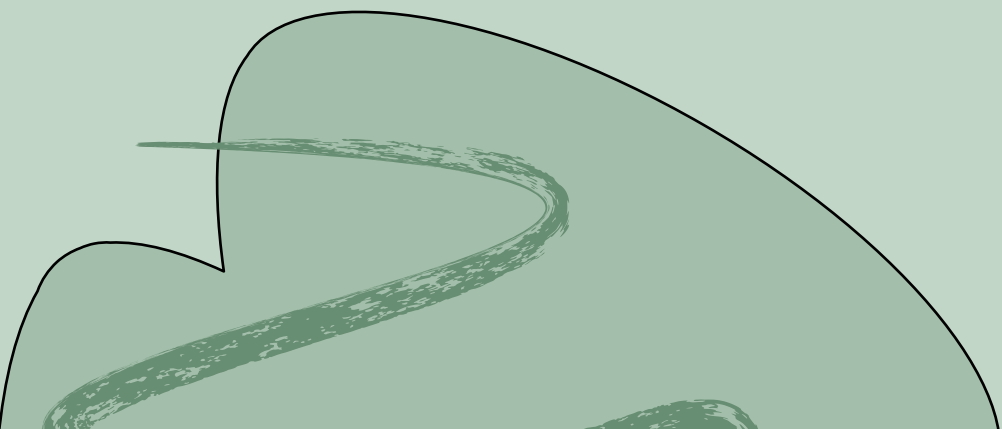

3. Main causes for climate changes

According to experts, there are two main causes of climate change: subjective causes and objective causes.

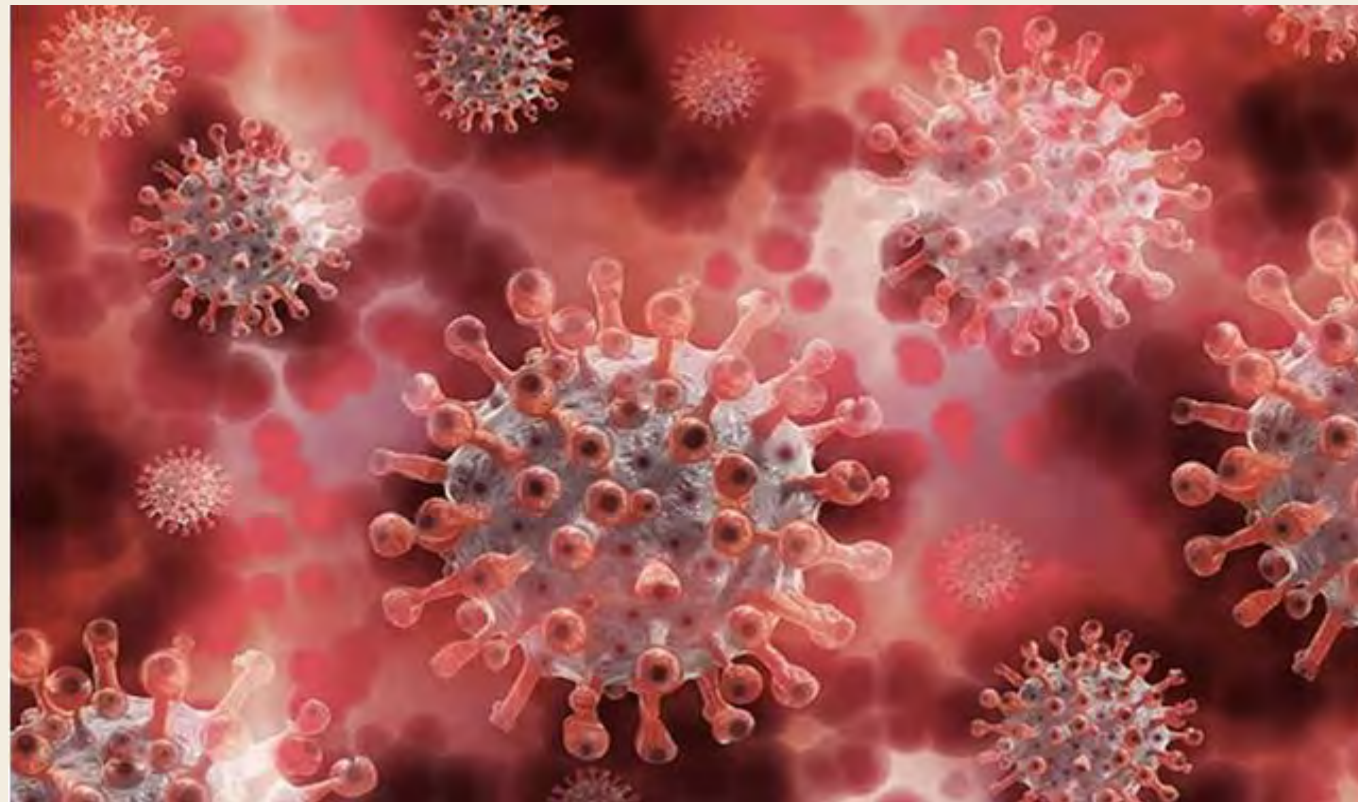

- Objective causes of climate change are natural such as redistribution of heat in the ocean, changes in the earth's orbit, mountain tectonic processes, changes in the continental shelf, and circulation. in the atmospheric system...
- The subjective cause is human impact leading to climate change. And this is also the main cause of climate change phenomena. The process of burning fossil fuels to produce electricity and heat simultaneously generates huge amounts of emissions globally.

Consequence from climate changes

- Severe weather changes
- Rising sea levels
- Species at high risk of extinction
- Threat to health
- Increased disease epidemic

Climate change in the world

Climate change in Vietnam

Vietnam is one of the countries heavily affected by climate change

- Impact on agriculture
- Impact on water resources:
- Impact on the environment and ecosystem
- Economic impact
- Social impacts

Solution

- Reduce greenhouse gas emissions
- Increase use of green energy
- Protect and restore the ecosystem
- Increase awareness and education
- Promote international cooperation to reduce CO2 emissions
